

REGAL Series of Document and Data Protection Cabinets

The Concept of Fire Prevention Products

Fire Protection Products commonly found in the market place are collectively known as Fire Resistant Cabinets (FRC). They are most suitable for protecting documents and data against the destruction by fire.

By international standard (JIS S 1037:1998), during a fire when the temperature rises up to 1000°C for a period of at least 1 hour, the interior of the FRC should remain at 180°C or lower to protect paper documents and at 52°C or lower to protect computer discs and their data. When removed after the test, the documents and diskettes should remain intact, accessible and fully legible.

The latest models of Data FRC and Document FRC, have produced lower internal temperatures when subjected to these tests.

Suitable for use in government agencies, military forces and defence facilities, Research and Development, financial institutions, insurance companies.
